Name:

Plant roots absorb water and **nutrients** from the soil. Have you ever sipped water from a straw? A plant's roots are like a straw. They suck up water and nutrients. This helps the plant to grow big and strong. People need vitamins and minerals to be healthy. Plants also need certain nutrients to survive. Nitrogen and calcium are two examples.

*People can get nutrients through a straw, much like a plant sucks nutrients in through its roots!*

*This plant's roots take in nutrients from the soil. Without roots, a plant wouldn't get what it needs to survive.*

Plants need many things to survive. Their parts help them get those things.

How do roots help plants survive?

There are many kinds of flowers.

6

A flower is another part of a plant. Flowers look pretty, but they also have a special job. They make seeds. Each seed can make another plant.

Let's take a closer look at flowers.

Many people's first names are also the names of flowers. Who do you know that has a flower name?

7

The fruit of the maple tree flies in the wind like tiny helicopters.

20

Many trees are pollinated by the wind. Corn, wheat, and other crops are also pollinated by the wind.

Flowers can be pretty or plain. They might smell good. That is not their only job. A flower's most important job is to make new plants.

Cut out some flower pictures from old magazines. Cut out some pictures of animal pollinators. Make a collage of flowers and their animal helpers.
